

Microbial metabolites influence the entire body

MetaBiome™ markers with the potential to **promote health**

- 
Butyrate
- 
Acetate
- 
Propionate
- 
Fibre degradation
- 
Microbial diversity
- 
3-indolepropionic acid (IPA)

MetaBiome™ markers with the potential to **reduce health**

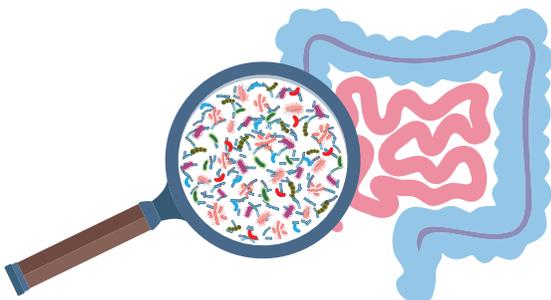

- 
Hexa-lipopolysaccharides
- 
Trimethylamine
- 
Hydrogen sulphide
- 
Protein degradation
- 
Human DNA

MetaBiome™ Test

WHAT DOES IT MEASURE?

When you provide a stool sample using your **MetaBiome™ Microbiome Sampling Kit** you gain valuable insight into your gut health. **MetaBiome™** is a comprehensive gut microbiome test which provides a comprehensive picture of the microbes in the gut and their functional potential. In this sense, **MetaBiome™** provides insight not only the spectrum of microbes living in the gut, but also their potential activity.

Your gut microbiome is the community of microorganisms that live in the gut.

MetaBiome™ measures the comprehensive spectrum of microbiome composition and function.

COMPOSITION

WHAT is in your microbiome?

MetaBiome™ reports on the composition of your microbiome, including which species are present, as well as the diversity of microbes.

FUNCTION

HOW functional is your microbiome?

The microbes in your gut are active. Their function is indicated by their potential to produce metabolites (biologically active substances that influence health).

MetaBiome™ Report

WHAT DOES IT SHOW?

MetaBiome™ reports on your gut microbiome diversity, the microbial species present, as well as their collective functional output, which are linked to various states of health and disease. The report provides you with a **MetaBiome™ Score**, which indicates your overall microbiome health. It is based on 11 metagenomic markers that are the most scientifically validated and relevant microbial metabolites and gut-based markers.

Your MetaBiome™ report provides you with an overall score.

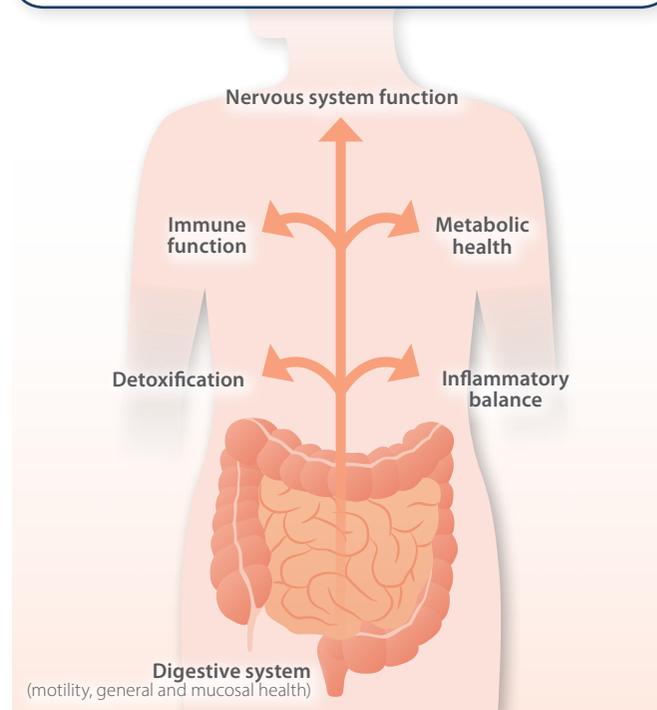

A healthy microbiome usually has a score of 70-100.

MetaBiome™ Analysis

HOW DOES IT HELP YOU?

By measuring your diversity and potential to produce specific gut metabolites, you and your Practitioner gain an understanding of your unique microbiome and how it may be affecting your health. Diet and lifestyle, as well as nutritional and herbal ingredients, may modulate microbiome composition and function. Therefore **MetaBiome™** analysis helps your Practitioner personalise your treatment plan, and monitor the health of your microbiome.

As well as your MetaBiome™ Score, information generated from the test provides insights into eight areas relevant to health.
